

Commercial Handrails

- **Distinctive Structures**
- **Your design or ours**
- **Range of distinctive timber profiles**
- **Detailed for durability**

While the rail in a public structure must use large members to meet the needs of crowd loading and resist vandal attack, the skill of the designer can be brought to this problem to provide unique and attractive answers.

Over the years Outdoor Structures Australia (OSA) has developed its own handrail systems and timber profiles which can be adapted to your project needs.

Alternatively we can work with you in developing a design which is unique to your project.

Our standard design loads and recommendations against application and fall heights are outlined in our boardwalk design guide.

OSA can take your architectural drawings and give you certified engineers drawings which incorporate world's best practice. Alternatively we can supply certified drawings of our standard product adapted to the specific needs of your project.
